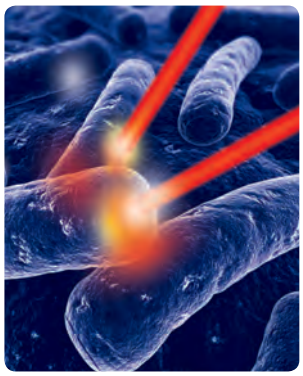
SKY Implant System

bredent
medical

we are One!

bredent group	**One** manufacturer in the field of implantology and prosthetics
bredent medical	**One** of the leaders in immediate restorations
HELBO	**One** bacterial infection control
SKY fast & fixed	**One** session is all it takes
BioHPP SKY elegance	**One** abutment for temporary and final restoration
Dentists, Dental Technicians, bredent group	**One** team
All patients	**Everyone** is satisfied



HELBO® antimicrobial photodynamic treatment (aPDT) combats bacterial infections and has been proven to preserve teeth and implants. No pain. No side effects. No resistances. The treatment has been a scientifically proven success for over 10 years.

Single-tooth restorations
Young people with a single-tooth gap benefit from a quick and aesthetic solution to their problem.

Potentially edentulous jaw
The SKY fast & fixed therapy is designed for patients aged between 40 and 65 who are facing losing their teeth and feel too young to wear a removable prosthesis. The treatment provides an immediate fixed restoration after just one intervention, with minimal impact on their quality of life.

Prosthesis fixation
This option is aimed at older patients who have already lost their teeth, but would like to be able to eat properly again and to enjoy going out in public without any worries.

bredent medical offers suitable treatments for all groups of patients.
In particular the immediate restoration options prevent errors and complications using standardised procedures and ensure cost-effective treatment – both for users and patients.

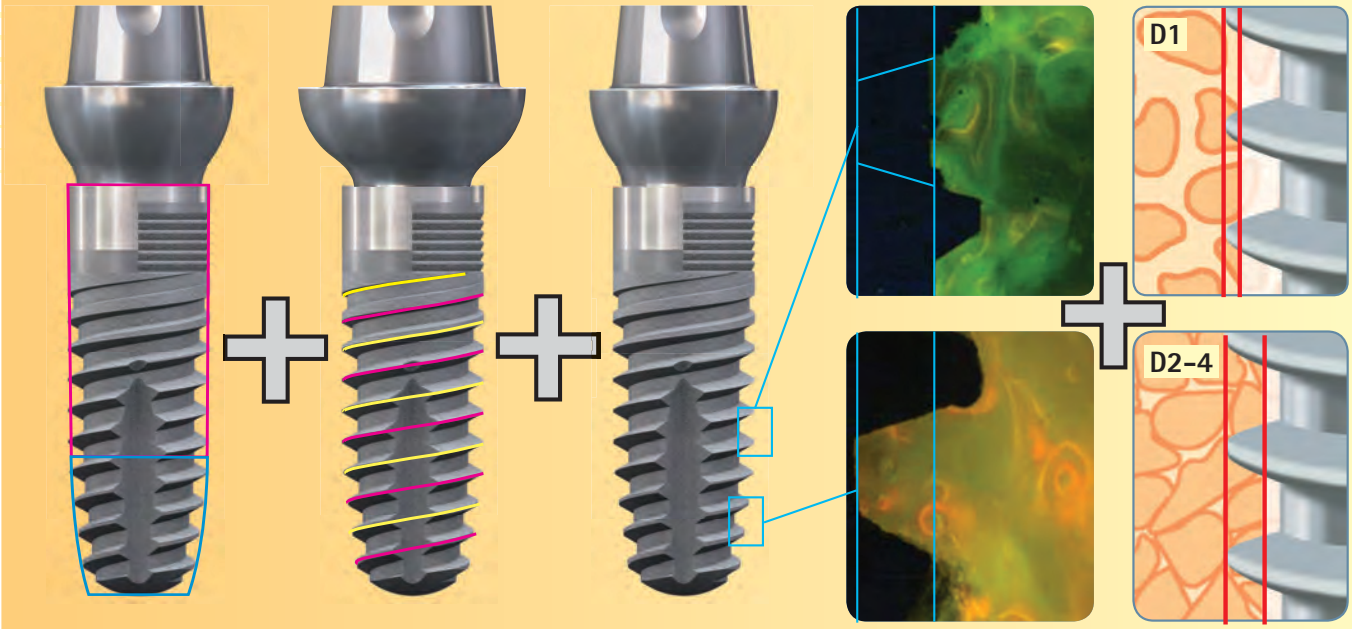
The diagrams are not all to scale.

Immediate restoration

SKY Implant system – The basis for immediate restoration

Immediate restoration places particular requirements on an implant system. The design of the SKY Implants and the corresponding surgical protocol ensure high primary stability in all bone qualities and therefore form a reliable basis for immediate restoration.

High level of primary stability =



Conical cylindrical implant shape

- Optimal and uniform load distribution of the chewing forces

Double thread

- Soft and uniform insertion
- No repeated trauma

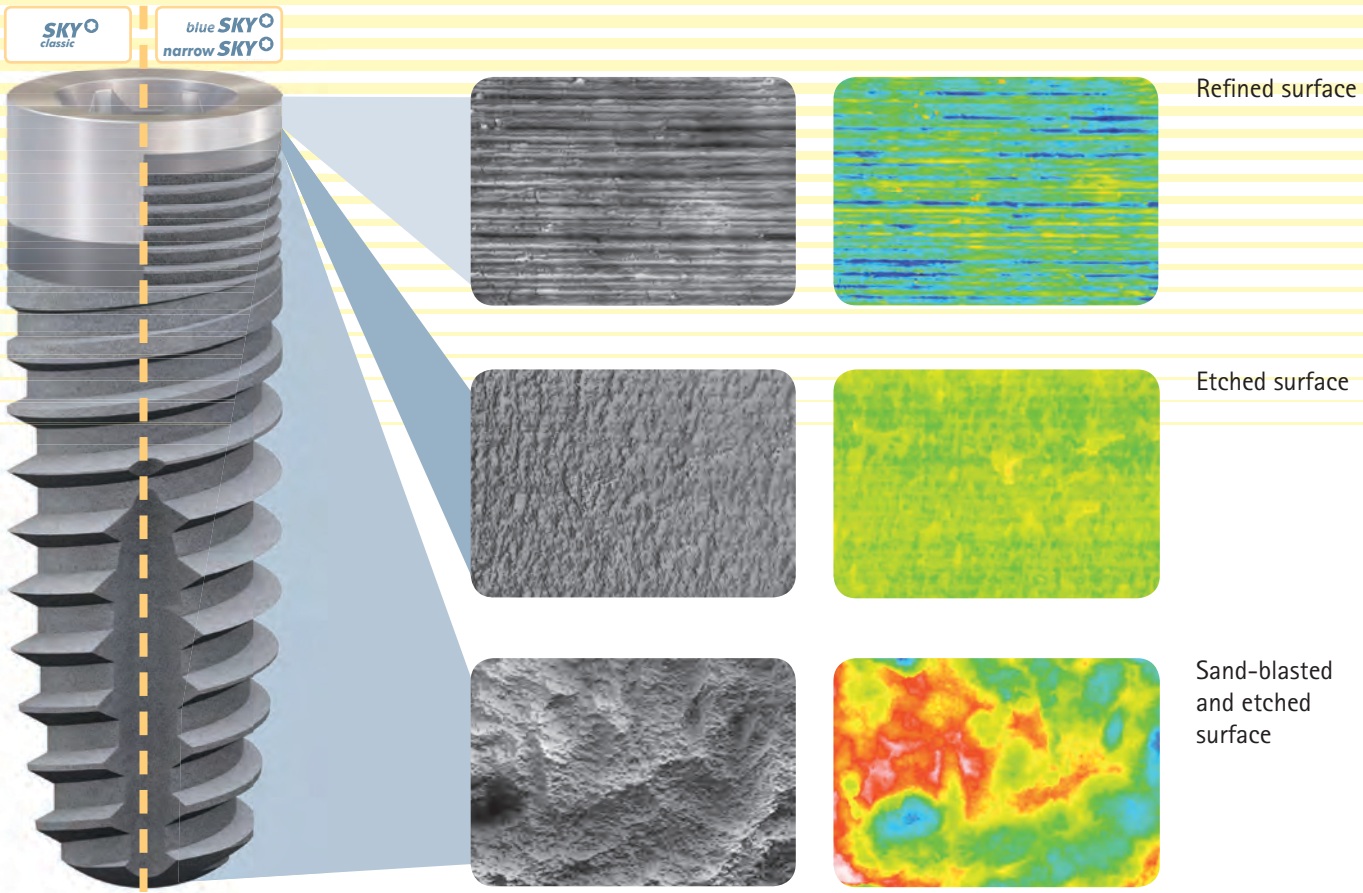
Self-cutting compression thread

- Bone-preserving

Surgical protocol tailored to bone quality

- Primary stability in every quality of bone

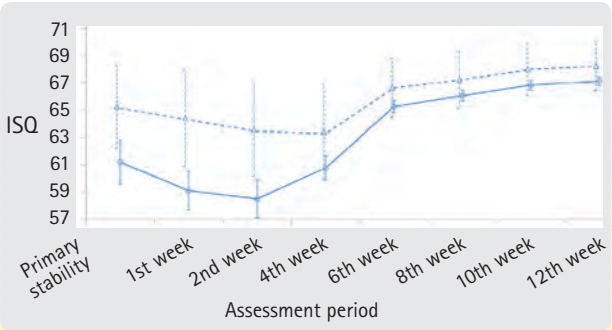
SKY Implant system – surface structure



The three-dimensional surface structure ensures rapid osseointegration with no loss of stability, thanks to the blasted and etched surface.

The two types of coronal neck design allow for optimal soft tissue attachment, which is enhanced by the etched surface and the horizontal micro-grooves of the refined surface.

Scientifically proven



Changes to implant stability during the 12-week monitoring period.

The extremely high level of primary stability only decreases very slightly after insertion and the *osseo connect*® surface leads to rapid osseous integration and to a high degree of stability.

Drilling + self-cutting blueSKY implant
Drilling + non-self-cutting competitor implant

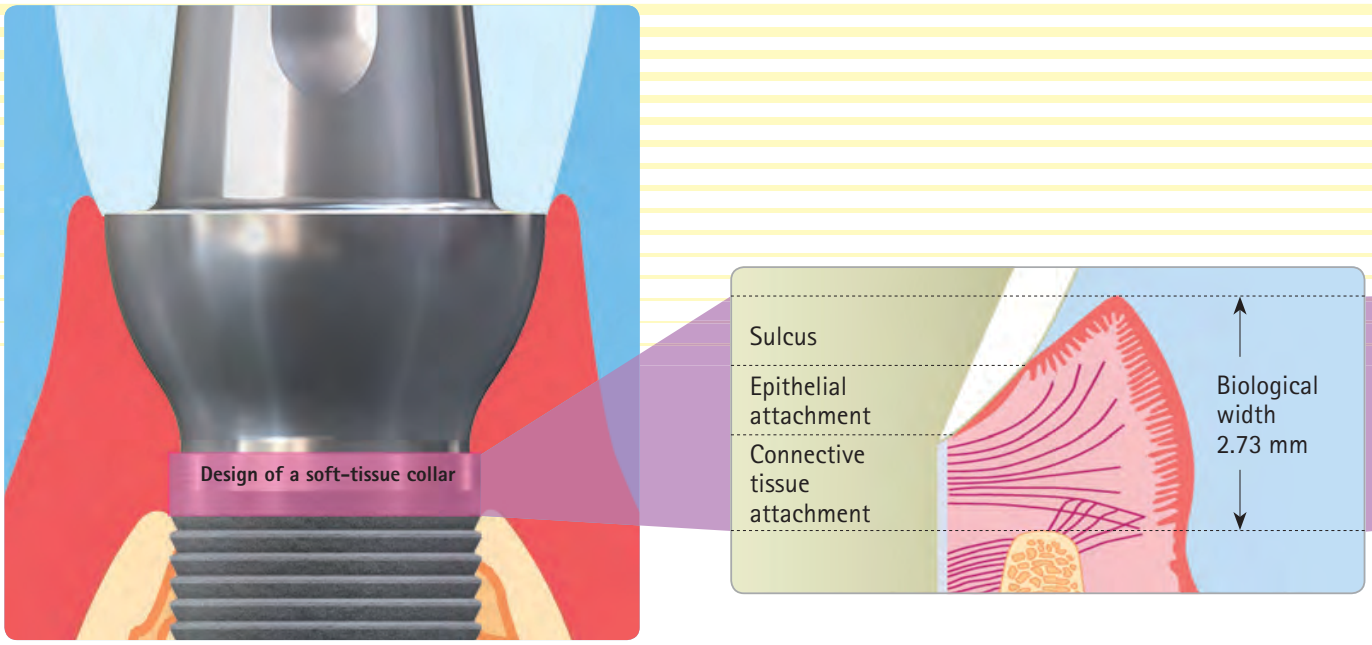
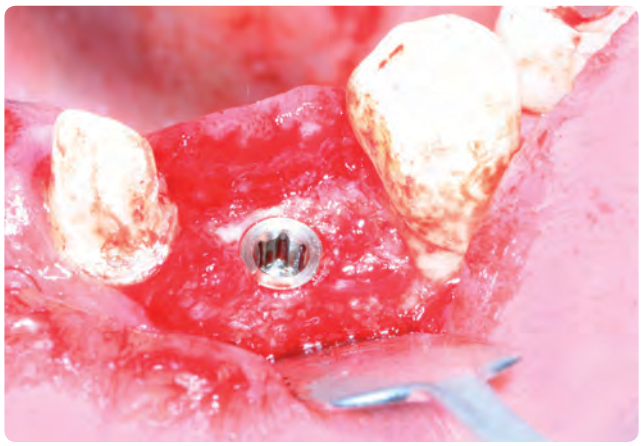
Immediate restoration

SKY Implant system – neck design

blue SKY Iso-crestal implant position



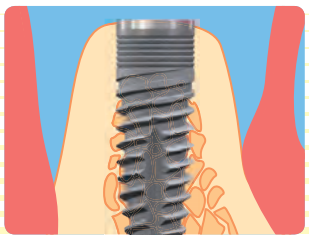
Indication



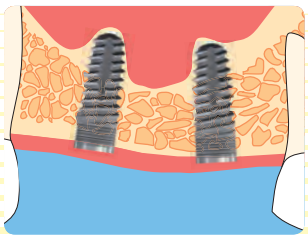
The coronally structured blueSKY implant is perfectly suited to being positioned flush with the bone.

The macro-grooves ensure a high level of bone preservation.

The blueSKY implant therefore works very well with augmentations.



Implant position flush wisth the bone



Augmented implant site

Jose Luis Calvo-Guirado et al.: Influence of collar design on peri-implant tissue healing around immediate implants: A pilot study in Foxhound dogs; Clin Oral Implants Res. 2014 Mar 31. DOI: 10.1111/clr.12374. [Epub ahead of print]

Jose Luis Calvo-Guirado et al.: Narrow- versus mini-implants at crestal and subcrestal bone levels. Experimental study in beagle dogs at three months; Clin Oral Investig. 2014 Dec 11. [Epub ahead of print]

SKY classic Semi-transgingival implant position

The refined surface of the SKY Implants in the neck region with:

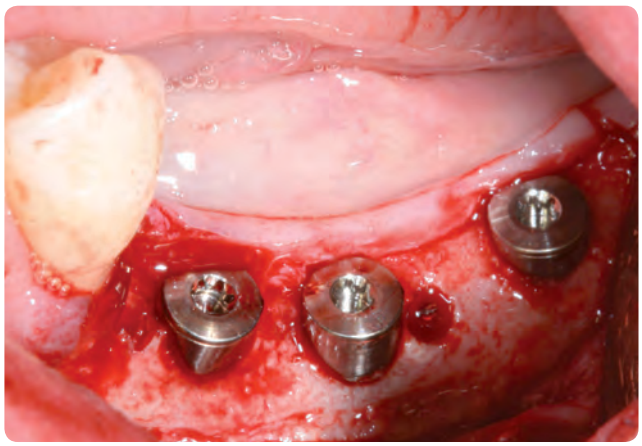
- horizontal micro-grooves, and
- an etched surface,

supports attachment of the connective tissue and allows for:

- soft-tissue attachment using a narrow collar for the blueSKY implant, and
- soft-tissue attachment using a wide collar for the SKY classic implant,

to the neck of the implant, which provides the implant with lasting protection.

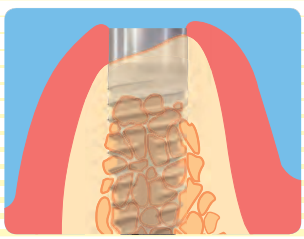
Indication



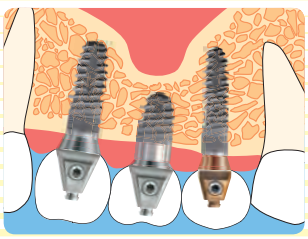
The SKY classic implant is ideal for preventing the bone from being ground off if the jaw ridge is narrow or irregular.

The 8 mm implant can be used as a short implant (6.5 mm) by way of supracrestal positioning.

The SKY classic implant is perfectly suited to flapless implantation, since the long, machined neck easily allows for a semi-transgingival implant position.



Semi-transgingival implant position



Short implants

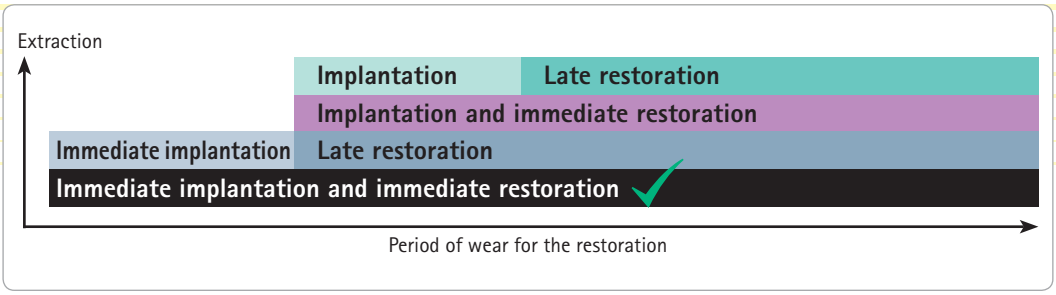
Immediate restoration

SKY Implant system – ideal for immediate restoration treatment using:

SKY fast & fixed	**Immediate restoration for potentially edentulous jaws**
BioHPP SKY elegance	**for rapid and aesthetic restoration of a single-tooth gap**



✓ **Advantageous for users and patients**

SKY fast & fixed
Immediate restoration for potentially edentulous jaws

- Reduced number of implants
- No extensive surgical procedures such as augmentations
- Standardised work steps make the work easier
- Reduction and prevention of errors and complications
- In many cases, immediate fixed temporary bridges after only one session
- At an affordable price

BioHPP SKY elegance
Immediate restoration for closing a single-tooth gap

Thanks to the properties of the high-performance polymer BioHPP:

- Protection during the healing phase thanks to reduced force on the implant (Off-Peak property)
- Gap closure using a temporary restoration immediately after implantation
- Immediate and without abutment change for final prosthetics (One-Time Therapy)
- Can also be directly and definitively restored as a crown abutment
- Protects the gingiva, therefore no repeated trauma
- Natural-looking prosthetic results

Implant platforms and implant abutment connections

bredent medical SKY Implant system

The SKY System is designed so that the number of prefabricated components is kept to a minimum.
For all indications which cannot be restored using these components, there are various custom solutions available.

Low number of prefabricated components ⟷ **Custom solutions**

SKY Implant Platform

The SKY System has two implant platforms:

- narrow Platform 3.5
- regular Platform 4.0

The Torx (an anti-rotation element) is identical in both implant platforms, meaning that all red-gold abutments approved for narrowSKY can also be used on blueSKY and SKY classic with Platform switch.

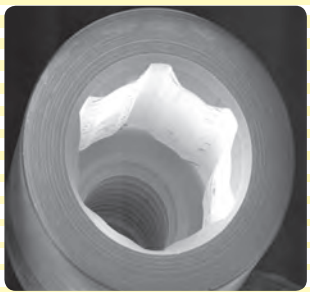
SKY abutment Platform

The SKY System has two abutment platforms:

- Abutment Platform Ø 3.5
  suitable for narrowSKY without Platform switch and blueSKY and SKY classic with Platform switch
- Abutment Platform Ø 4.0
  suitable for blueSKY and SKY classic without Platform switch

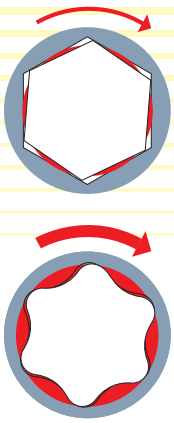
T: (+49) 0 73 09 / 8 72-4 41 | F: (+49) 0 73 09 / 8 72-4 44| www.bredent-medical.com | @: info-medical@bredent.com

SKY Implant abutment connections



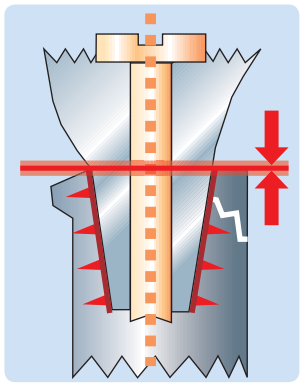
If screws and screw joints are involved. The Torx® is the gold standard in mechanical engineering and the automotive industry and in implant dentistry as well.

All SKY Implants have a Torx® connection.



Torx®: has six large force transfer surfaces

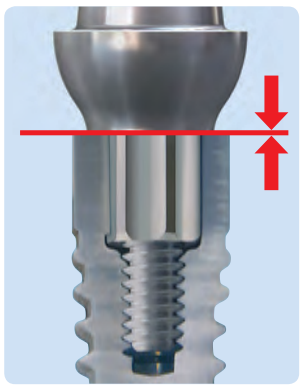
- significantly higher torques for the same force applied
- easier insertion of the implant
- no damage to the internal geometry at a high torque either



Conical connections

- No definitive vertical abutment height
- Height difference between laboratory and clinic
- Passive fit of bridge constructions very difficult

Conical connection
Flat connection



Flat connections (SKY System)

- **Defined** abutment height
- Passive-fit of bridge and bar restorations easier to achieve

12 orientation positions

Owing to the normal position and the R variants, there are 12 positions for the orientation of the angled abutments. Therefore, the abutment can be easily oriented to the best position in the laboratory after the operation.

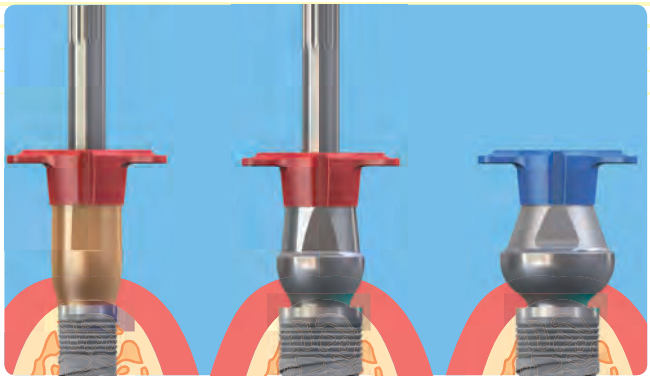
SKY esthetic impression abutments



For the impression of SKY esthetic abutments, appropriate impression abutments for open and closed trays are available for each diameter. The impression abutments feature the following characteristics:

- The sulcus shape of the impression abutment is based on the SKY esthetic Line
- The abutment has coronal retentions; suitable impression copings can snap in these retentions.
- The copings can be aligned in 6 positions so that impressions can also be taken in small gaps without any problem
- The impression abutments are available in the diameters M and L, for open and for closed trays
- The screws are retained safely in the impression abutments so that they cannot fall out during the application

SKY zirconium abutments

SKY esthetic line

4.0 **blueSKY**
SKY classic

In the laboratory, the prefabricated zirconium abutment is bonded to a titanium bonding base. The SKY zirconium abutments are in dentine colours.

Important:
The SKY zirconium abutments must not be subjected to grinding, as the minimum wall thickness is required in order to guarantee long-lasting stability.

In cases where restoration cannot be optimally achieved using the prefabricated SKY zirconium abutments owing to their angle or orientation, it is recommended that a custom ceramic abutment be produced, for example using the SKY uni.fit CAD titanium bonding base.

3.5 **blueSKY**
SKY classic

The BioHPP SKY elegance abutments are hybrid abutments in which the abutment body made of BioHPP is connected to the titanium base without a gap. These abutments are best used for One-Time Therapy for immediate restoration, since they combine the properties of a temporary and a definitive abutment, i.e. it is not necessary to change the abutment. As a result, the gingiva is not subjected to multiple traumas. In addition, the time and costs are reduced.
BioHPP can be ground in the mouth as easily as dentine using carbide milling tools.

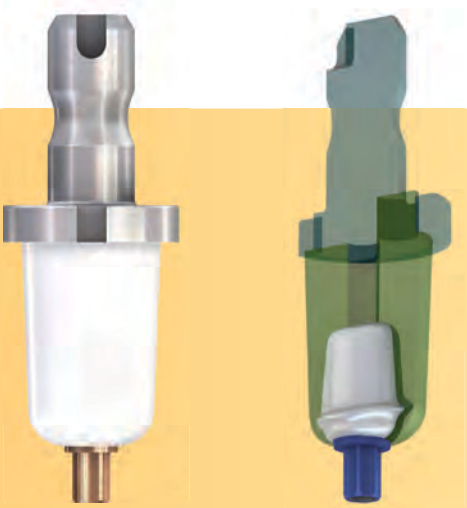
Custom abutments – conventional or CAD/CAM

Custom abutments with a natural emergence profile through the gingiva provide the best aesthetics and will satisfy even the most demanding of patients.
Using the SKY System, custom abutments can be produced both conventionally by wax modelling and using a digital workflow.

Conventional workflow

The following options for producing custom abutments are available with the conventional workflow:

- BioHPP SKY elegance titanium bases for producing hybrid abutments from BioHPP
- SKY abutments which can be cast on for producing high-gold-content abutments
- SKY uni.fit CAD titanium bases with modelling sleeve for the bonding technique



CAD/CAM workflow

The following options for producing custom abutments are available with the digital workflow:

- SKY uni.fit CAD titanium base for the bonding technique
- SKY uni.fit titanium base for CEREC® for the bonding technique in the closed CEREC ®workflow
- BioHPP SKY elegance prefab

REF SKYETB00

A custom abutment in a natural tooth shape is modelled on the BioHPP SKY elegance titanium base (sand-blasted by the technician). It is then embedded and remoulded with BioHPP in the *for*2press device.
This custom BioHPP abutment can then be directly veneered with the visio.lign veneer system to form a crown abutment or can be restored using a crown or a bridge.

BioHPP SKY elegance prefab

3.5

narrowSKY
blueSKY
SKY classic

Image on a very small scale

With the BioHPP SKY elegance prefab, the abutment body made of BioHPP is pressed onto the BioHPP SKY elegance titanium base without a gap and forms a perfect mechanical connection. The required tooth shape for the custom abutment is designed in CAD software and the corresponding data set is passed on to the machine manufacturing stage.

This is already possible using systems from the following providers:

- DATRON®
- imes.icore®
- Roland®
- röders Tec®

A wide range of indications can be restored in this way:

- Custom abutments for single-tooth and bridge restorations – also suitable for immediate restoration
- Crown abutments
- Telescopes

SKY uni.fit titanium base for CEREC®

REF SKYUFCTB

The SKY uni.fit titanium base for CEREC® combines the SKY Implant abutment connection with the abutment geometry of the CEREC® TiBase S. It is therefore possible to produce custom abutments for restoration with SKY Implants using the CEREC® system.

- The implant position is scanned using the original Sirona® scan bodies:
  - Scan bodies for Bluecam® S
  - Scan bodies for Omnicam® S.
- For construction in the CEREC® software, a suitable implant is selected from the library, e.g. Camlog® 3.8.
- All CEREC® blocks with the S geometry can be used for this process.
- The subsequent bonding is carried out according to the manufacturer's instructions.

Can be ordered from Sirona®

In addition to the SKY fast & fixed abutment system, we now also offer the SKY uni.cone abutment system with a reduced diameter of 4.5 mm, meaning that high-quality aesthetic restorations, which can be screwed either occlusally or transversely, can be carried out quickly and simply even in atrophied jaws.

The SKY uni.cone abutment system is copper-color anodized for better distinction in the patient's mouh and in the laboratory.

A typical application for SKY uni.cone is the combination with SKY fast & fixed in the lower jaw. Implants placed at an angle are attached to the normal SKY fast & fixed abutments and the SKY uni.cone abutments are placed on the straight abutments in the corresponding height.

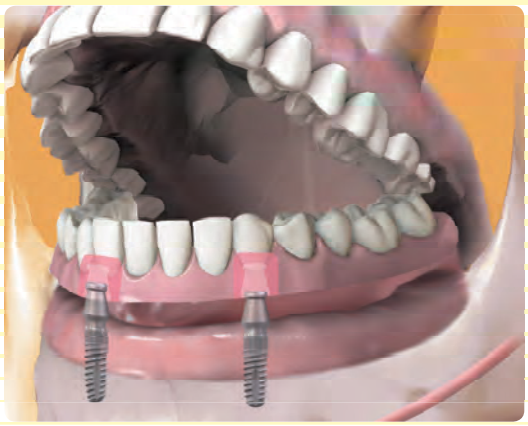
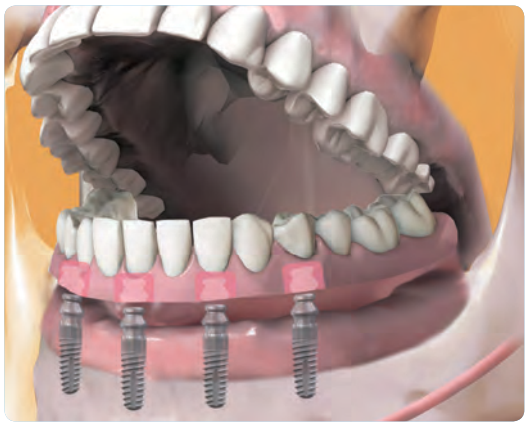
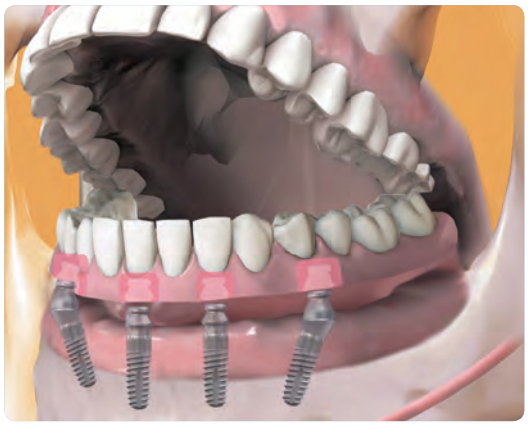
retention.sil & SKY TiSi.snap – Application



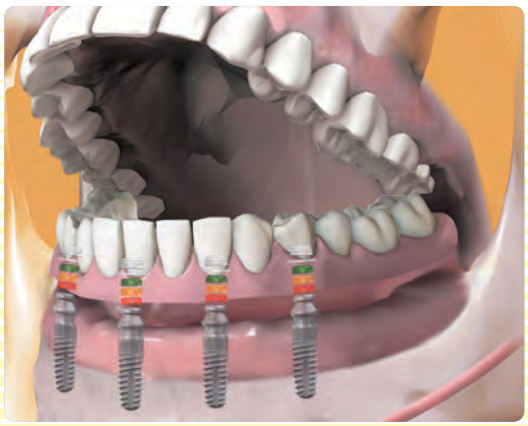
The high guide cone of the SKY TiSi.snap abutments allows safe and reliable fixation of dentures with only two implants. As a result, perfect control of the denture during removal and integration is ensured and tilting is avoided to obtain increased stability of the entire restoration during masticatory stress and provide the patient with high wearing comfort.



The low guide cone of the SKY TiSi.snap abutments is particulary suitable for dentures with slender designs. In such cases, retention.sil is integrated into the denture from the basal direction. The use of at least 3 implants with SKY TiSi.snap abutment is recommended.



In cases of low bone height, the implants can be placed at an angle to make optimum use of the local bone. Thanks to the use of angled SKY TiSi.snap abutments on implants with oblique placement, the path of insertion is adjusted.



If an increased retention force is required and the pull-off force of retention.sil is not sufficient, the pull-off force can be raised up to almost 2 kg for each part for 10° to 20° by using the Locator® retention elements.

Surgical protocol tailored to bone quality

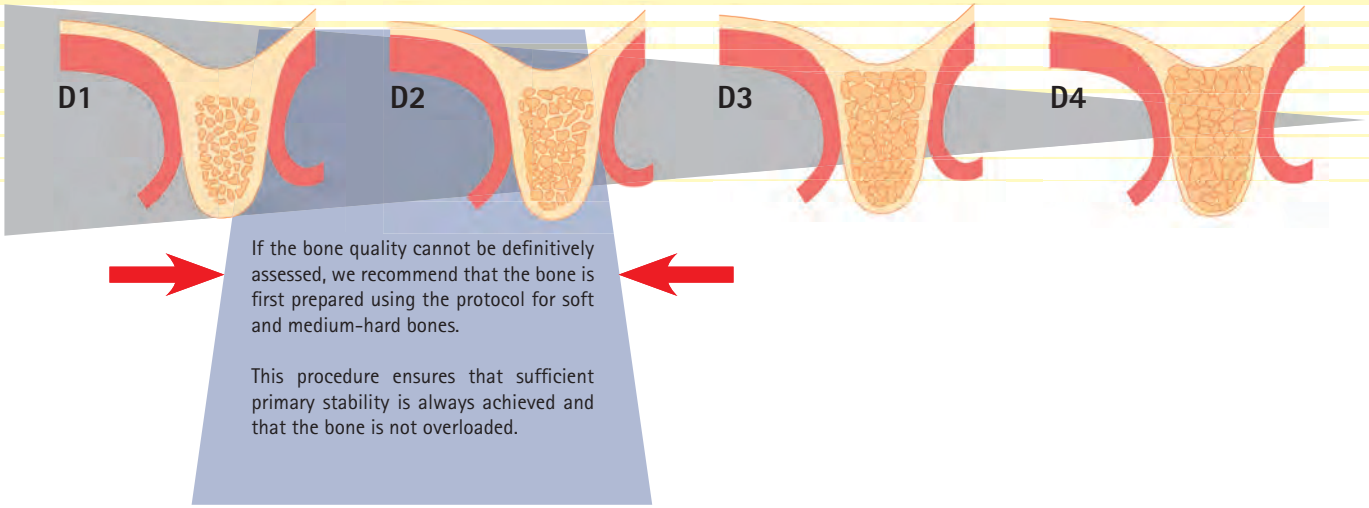
Bone density from hard to soft

Hard bone

Atraumatic tapping
Prevention of bone overloading during surgery

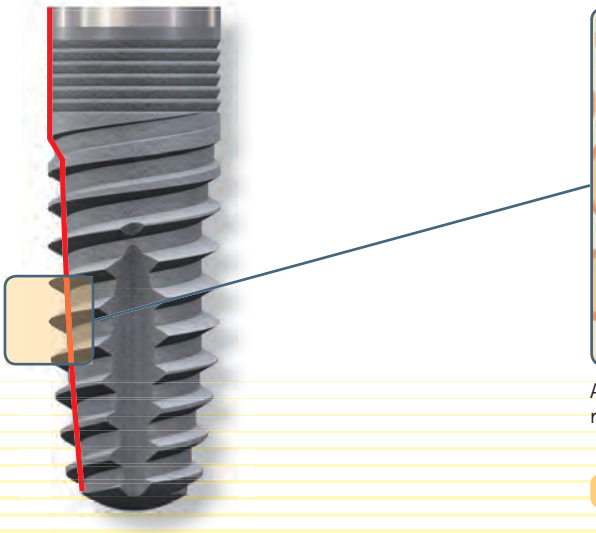
Medium-hard to soft bone

Bone compression
Achieving primary stability

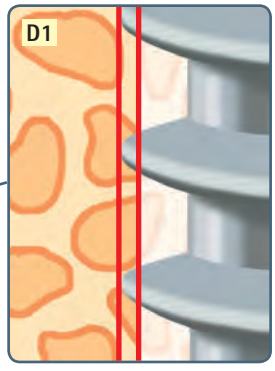


If the bone quality cannot be definitively assessed, we recommend that the bone is first prepared using the protocol for soft and medium-hard bones.

This procedure ensures that sufficient primary stability is always achieved and that the bone is not overloaded.

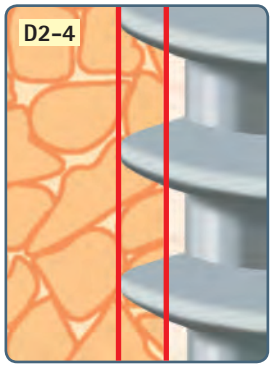


Hard bone



Atraumatic tapping thanks to reduced contact area

Medium-hard and soft bone



Apical compression thanks to increased contact area

Consistently high primary stability

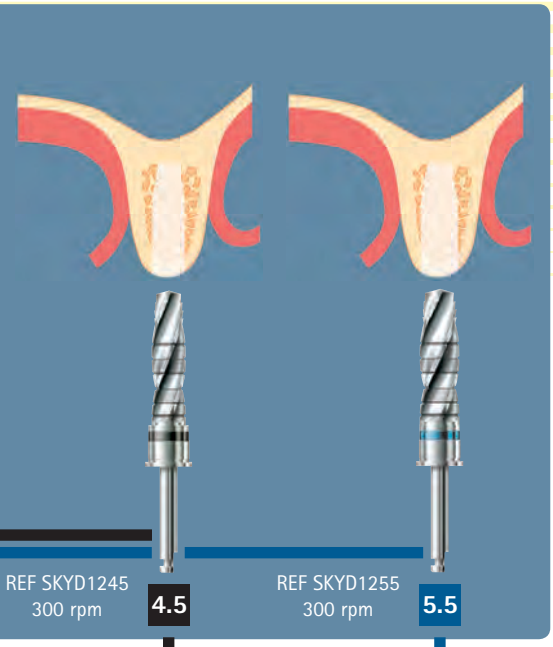
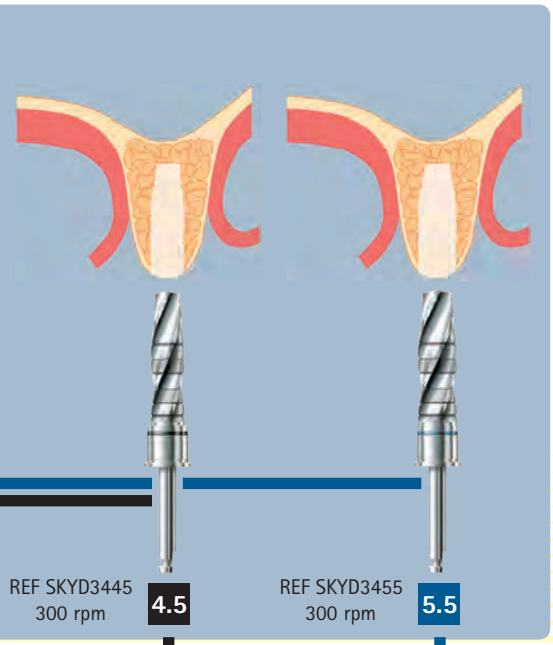
The detachable drill stops are arranged so that they can be easily taken up with the drill and fastened with one hand thanks to the cavities in the OP-Tray insert. The ruler on the compartment for small parts helps to select the correct drill stop easily and quickly. The drilling depth is approx. 0.7 mm greater than the implant length.

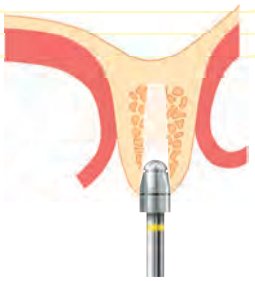


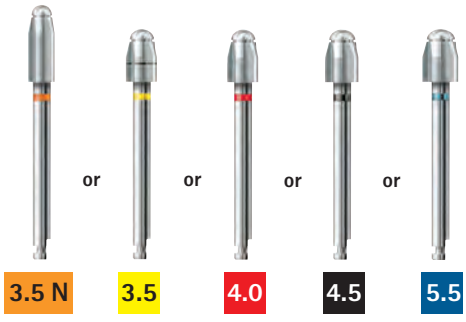


With the 3.5 diameter blueSKY and SKY classic implants, the crestal drill is only sunk up to the laser marking.

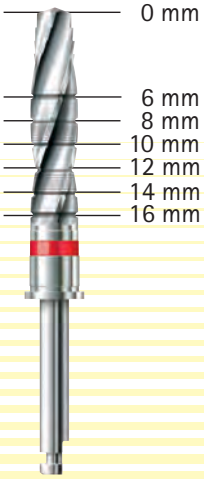
In the following implants:
- narrowSKY
- blueSKY 4.0 to 5.5
- SKY classic 4.0 to 4.5

the crestal drill is completely inserted.





Crestal drill
300 rpm

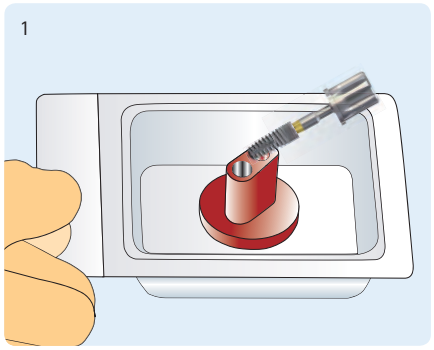


Technical specifications SKY

Fast, reliable and atraumatic implant placement

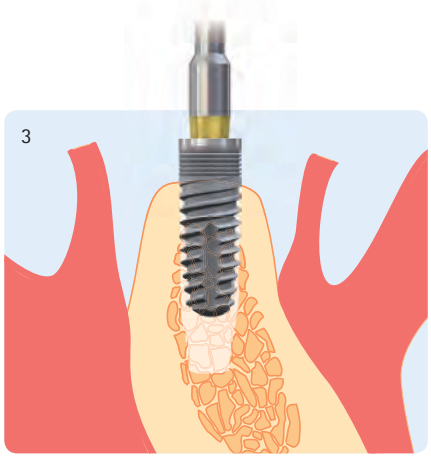
Removing and screwing in the implant and the cover screw without changing instruments.

blueSKY and SKY classic implants come in double-sterile packaging. They are supplied in a colour-coded carrier with details of the applicable length so that mistakes can be avoided. After opening the Tyvek-Folie® foil, it can be directly removed using the SKY TK insertion instrument.

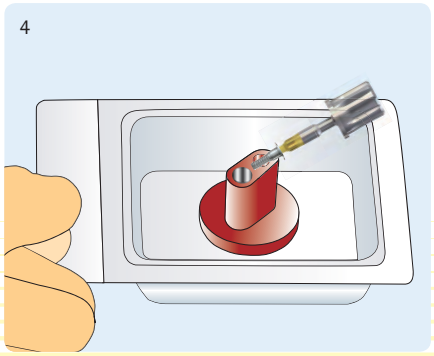


Open the new double sterile packaging. Remove the implant with the insertion instrument for the ratchet or the contra-angle.

The conical Torx® allows to hold the implant safely.

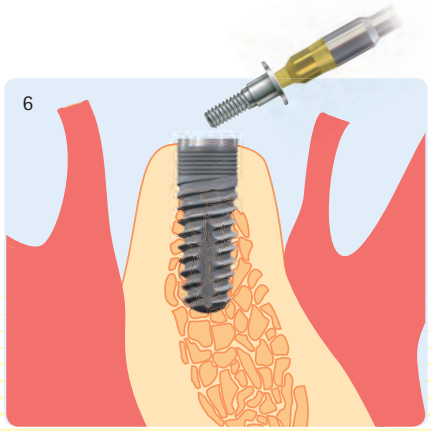


The implant is inserted and can be screwed in immediately.



The cover screw can be removed using the same instrument.

The cover screw is held securely by the cone.



Screw the screw directly into the implant. The smooth cone ensures that the screw only needs to be slightly tightened and cannot become jammed. Recommended max. torque: 10 Ncm.

Screws

blueSKY
SKY classic

In two posters presented at the SKY Meeting 2012, Dr. Wentaschek from the University of Mainz illustrated how Pretension can be significantly reduced by repeatedly tightening the screw. Pretension is the decisive crucial factor for the implant-abutment connection. It is therefore recommended that the appropriate laboratory screws are used in the laboratory, in order to prevent screw loosening.
These results can be transferred to the recall. In this case, we recommend replacement of the screws when the abutment is removed for cleaning.

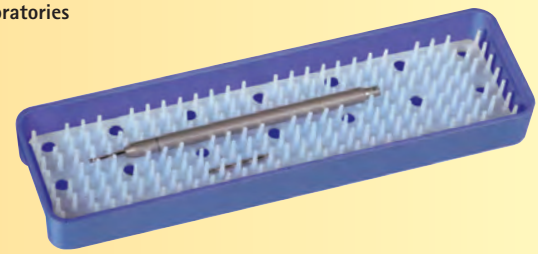
Practice

Laboratories



The torque ratchet in the SKY prosthetic case for practices ensures that all prosthetic components of the SKY System can be tightened permanently and reliably. The case contains two screwdrivers - short and long - for fixation of all abutments as well as the screwdriver for the SKY ball head attachments. The screwdrivers for the SKY Locator® and for transverse screwing are used with the adapter and the ratchet.

The long laboratory handle contained in the SKY prosthetic case for laboratories enables perfect handling and use of the screws on the master models. Appropriate latch-grip screwdrivers are securely held in the adapter for contra-angles and can be exchanged easily. As a result, the SKY abutment screws of the SKY Locator® and the transversal screw can be easily fastened and unfastened. The screwdriver for the SKY ball head attachment is located at the other end of the laboratory handle.

Presentation of the miniSKY system

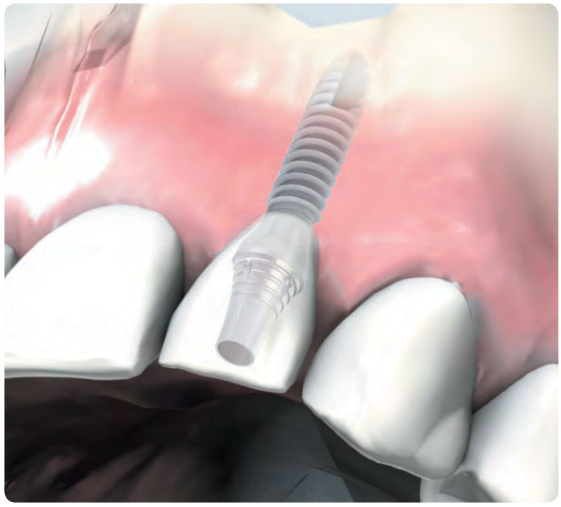
bredent medical

miniSKY Implant system

The solution for badly atrophied jaws and narrow gaps

Problems in older patients who have already lost their teeth:
- Severely atrophied jaw
- Prosthesis will no longer hold
- Eating difficulties
- Fear of major surgical interventions
- Fear of social isolation

miniSKY for prosthesis fixation:
- mini¹SKY with ball head and O-ring or precious metal matrix
- mini²SKY with locator



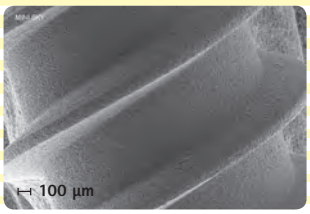
Problems in patients with very narrow tooth gaps:
- Narrow edentulous space
- Aesthetic restoration required
- Low bone level despite remaining teeth

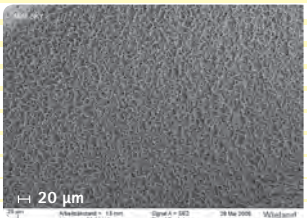
mini²SKY for aesthetic restoration of narrow gaps:
- Two implant diameters and one implant platform
- Semi-transgingival implant avoids a second operation
- Conical outer connection ensures a secure and long-lasting connection

miniSKY diameter-reduced implants

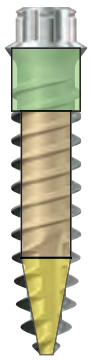
The mini[1]SKY and mini[2]SKY Implantate feature the proven *osseo connect* surface (*ocs*®) of the blueSKY implants to ensure fast and reliable osseointegration.

The SEM photos show the uniformly rough surface which provides ideal preconditions for the apposition of osteoblasts, which is supported by the exceptional hydrophilic properties of the implants.





miniSKY – Technical data



Three-step functional design

- Cortical relief
- Central stabilization
- Special tip

- Implant Platform 3.2 mm
- Implant diameter 2.8 mm und 3.5 mm

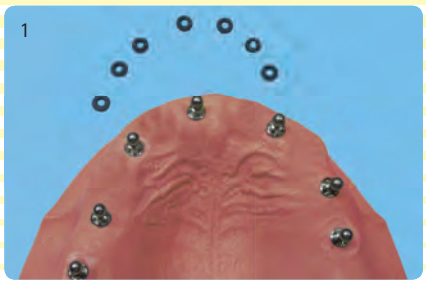
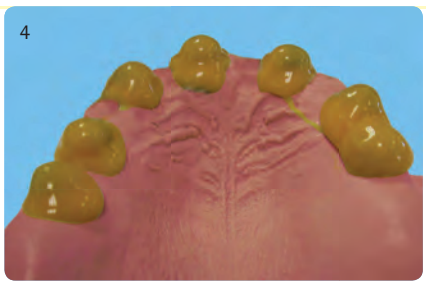
mini¹SKY – Impression and model fabrication



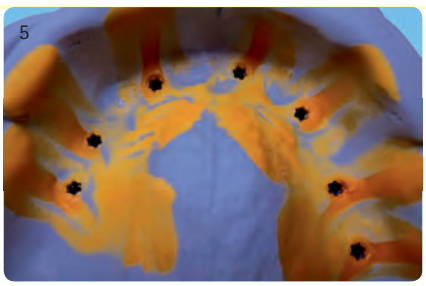
Initial situation

When making an impression of the mini¹SKY implants, the o-ring (SKY-OR55) is placed over the ball head

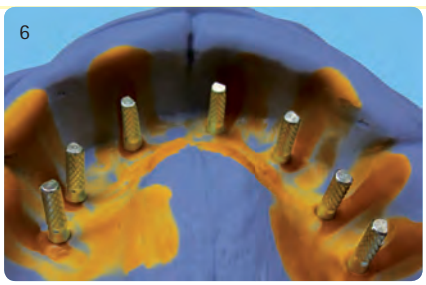
The torx of the mini¹SKY implants and the o-rings is then fully molded using the impression material, brecision implant light (580 BL050).



At the same time, the impression material brecision implant heavy (580 BH38 0) is added to an impression tray and applied to the area being molded.



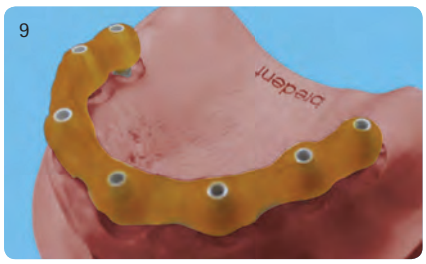
Once the impression material has cured, it is possible to carefully remove the impression tray. The o-rings remain in the impression. The torx of the mini¹SKY implants is clearly recognizable and aids repositioning of the laboratory analog.



When repositioning the implant analog (m1SKYX-IA), it is necessary to bear in mind that the torx geometry in the impression material corresponds with the orientation of the torx from the implant analog.

Using a gingival mask, Multisil-Mask hard (540 0113 4), the implant analog must be blocked,

ensuring that the exact position of the implant analog is maintained during model fabrication.



Control using a bridge framework has resulted in a high level of precision between the initial model and the model from the impression.

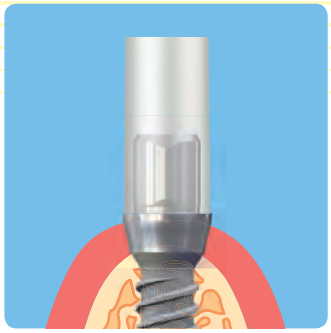
mini²SKY Individual abutment

mini²SKY



With the new mini²SKY uni.fit abutment, laboratory-produced individual abutments can be manufactured on mini²SKY, which means that optimal aesthetics can be achieved even in narrow gaps. The individual abutments are cemented in the laboratory on the very low titanium base.

OP-Tray with drills and instruments

The miniSKY OP-tray, OT 41, contains all of the drills and instruments needed for inserting the miniSKY implants.

All of the instruments can be easily assigned and identified by means of the images and order numbers.

The miniSKY OP-Tray OT41 can be easily cleaned and sterilised. Owing to its small dimensions, it also fits on any operating table.

Patient brochures about our therapies

Request the patient brochures in the format 210 x 210 mm free of charge and recommend the therapies of bredent medical in a way that patients can easily comprehend.

Smile again... with dental implants!

REF 000 540G B

This patient brochure provides an overview of the functionality of implant restorations and the therapeutic options available for such restorations:

- gap closure, e.g. in case of single tooth loss
- partially edentulous ridges
- fixation of dentures

Oral health – for a lifetime

REF 000 484G B

The antimicrobial photodynamic HELBO® therapy controls bacterial infections and has proven its reliability for the preservation of teeth and implants. No pain. No side effects. No resistances. The success has been scientifically proven for more than 10 years.

Suitable posters for our therapies
